MINGUS - Melodic Improvisation Neural Generator Using Seq2seq

Fall 2020 project

Outline

- Introduction
- State of the art
  1. Discovering Music Relations with Sequential Attention (Jiang, Xia, Berg-Kirkpatrick, 2020)
  2. Explicitly Conditioned Melody Generation: A Case Study with Interdependent RNNs (Genchel, Pati, Lerch, 2019)
- Approach
- Results
- Conclusions

Jazz standard structure

A jazz improvisation is a live sequence generation with constraint

Challenges of jazz music

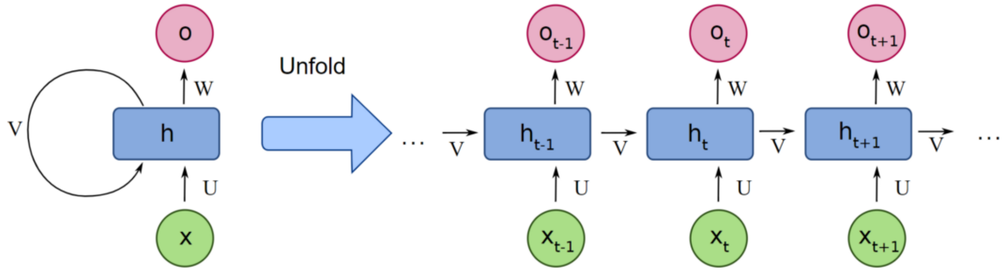
- Uneven time divisions (triplets, quintuplets…)
- Different time signatures
- Complex chord structures (many extensions)
- Complex harmony

State of the art

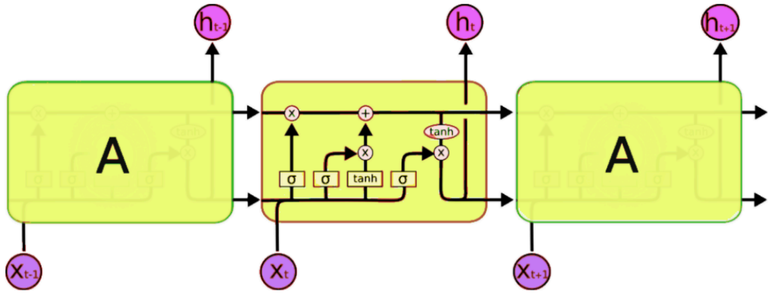
RNNs vs Transformer

RNN vs Transformer

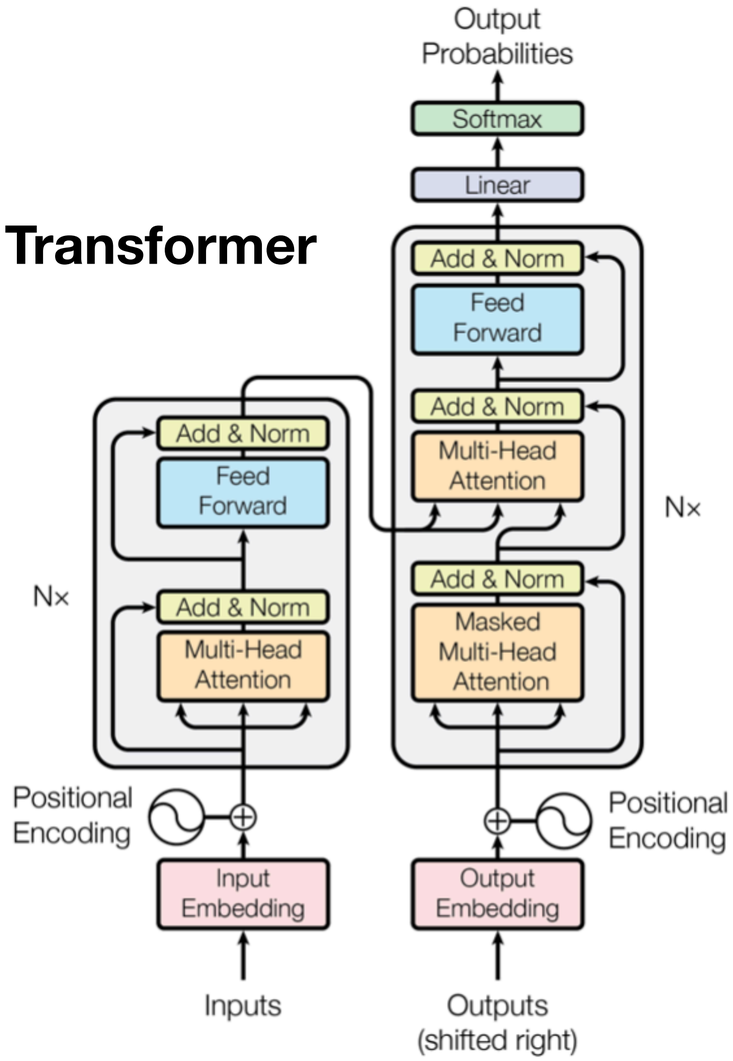
Recurrent Neural Network (RNN)



Long Short Term Memory (LSTM)



Transformer



State of the art

1. Discovering Music Relations with Sequential Attention (Jiang, Xia, Berg-Kirkpatrick, 2020)

Sequential Attention unit

$$[s^{(1...H)}; \tilde{q}_N^{(1...H)}] = \text{SeqAttn}(\mathbf{q}_{1...N-1}, \mathbf{k}_{1...N}, e) \quad (1)$$

$$h_N = \text{LSTM}(f_1, f_2, ..., f_{N-1}) \quad (2)$$

$$[s^{(1...H)}; \tilde{q}_N^{(1...H)}] = \text{MLP}([h_N; k_N]) \quad (3)$$

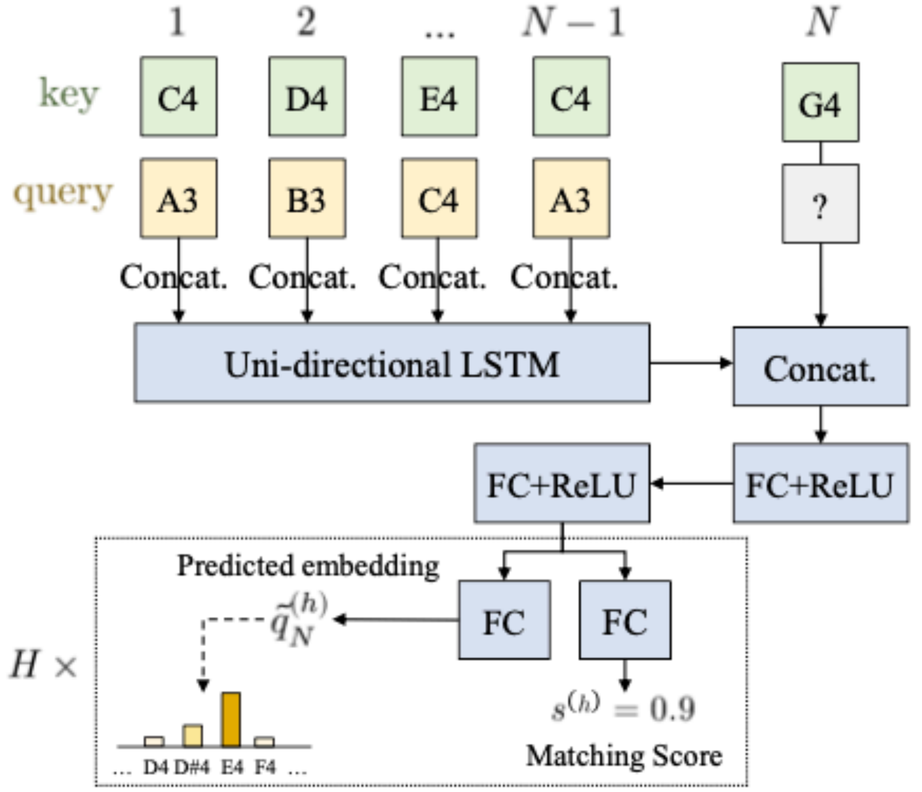
Self-Attention Layer

$$[s_i^{(1..H)}; \tilde{x}_{N,i}^{(1..H)}] = \text{SeqAttn}(\mathbf{x}_{1...N-1}, \mathbf{x}_{1-i...N-i}, e_i) \quad (4)$$

$$\hat{s}_i^{(h)} = \frac{\exp(s_i^{(h)})}{\sum_{i'} \exp(s_{i'}^{(h)})} \quad (5)$$

$$\tilde{x}_N^{(h)} = \sum_i \hat{s}_i^{(h)} \tilde{x}_{N,i}^{(h)} \quad (6)$$

$$\tilde{x}_N = \text{Linear}([\tilde{x}_N^{(1)}; ...; \tilde{x}_N^{(H)}]) \quad (7)$$



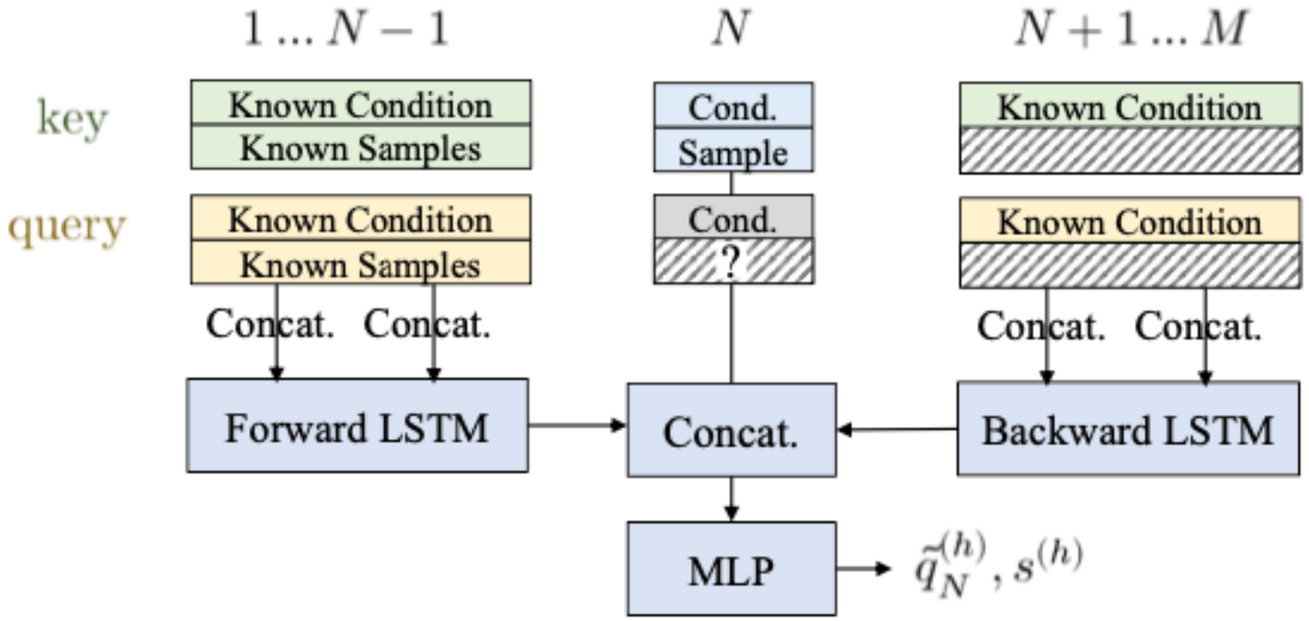
Conditional sequential attention

Used for chord conditioning

$$\overrightarrow{h}_N = \mathrm{LSTM}_{\mathrm{fw}}(f_1, f_2, ..., f_{N-1}) \quad (8)$$

$$\overleftarrow{h}_N = \mathrm{LSTM}_{\mathrm{bw}}(b_M, b_{M-1}, ..., b_{N+1}) \quad (9)$$

$$[s^{(1...H)}; \tilde{q}_N^{(1...H)}] = \mathrm{MLP}([\overrightarrow{h}_N; \overleftarrow{h}_N; k_N; q_N^c]) \quad (10)$$



State of the art

2. Explicitly Conditioned Melody Generation: A Case Study with Interdependent RNNs (Genchel, Pati, Lerch, 2019)

Data representation

To be estimated

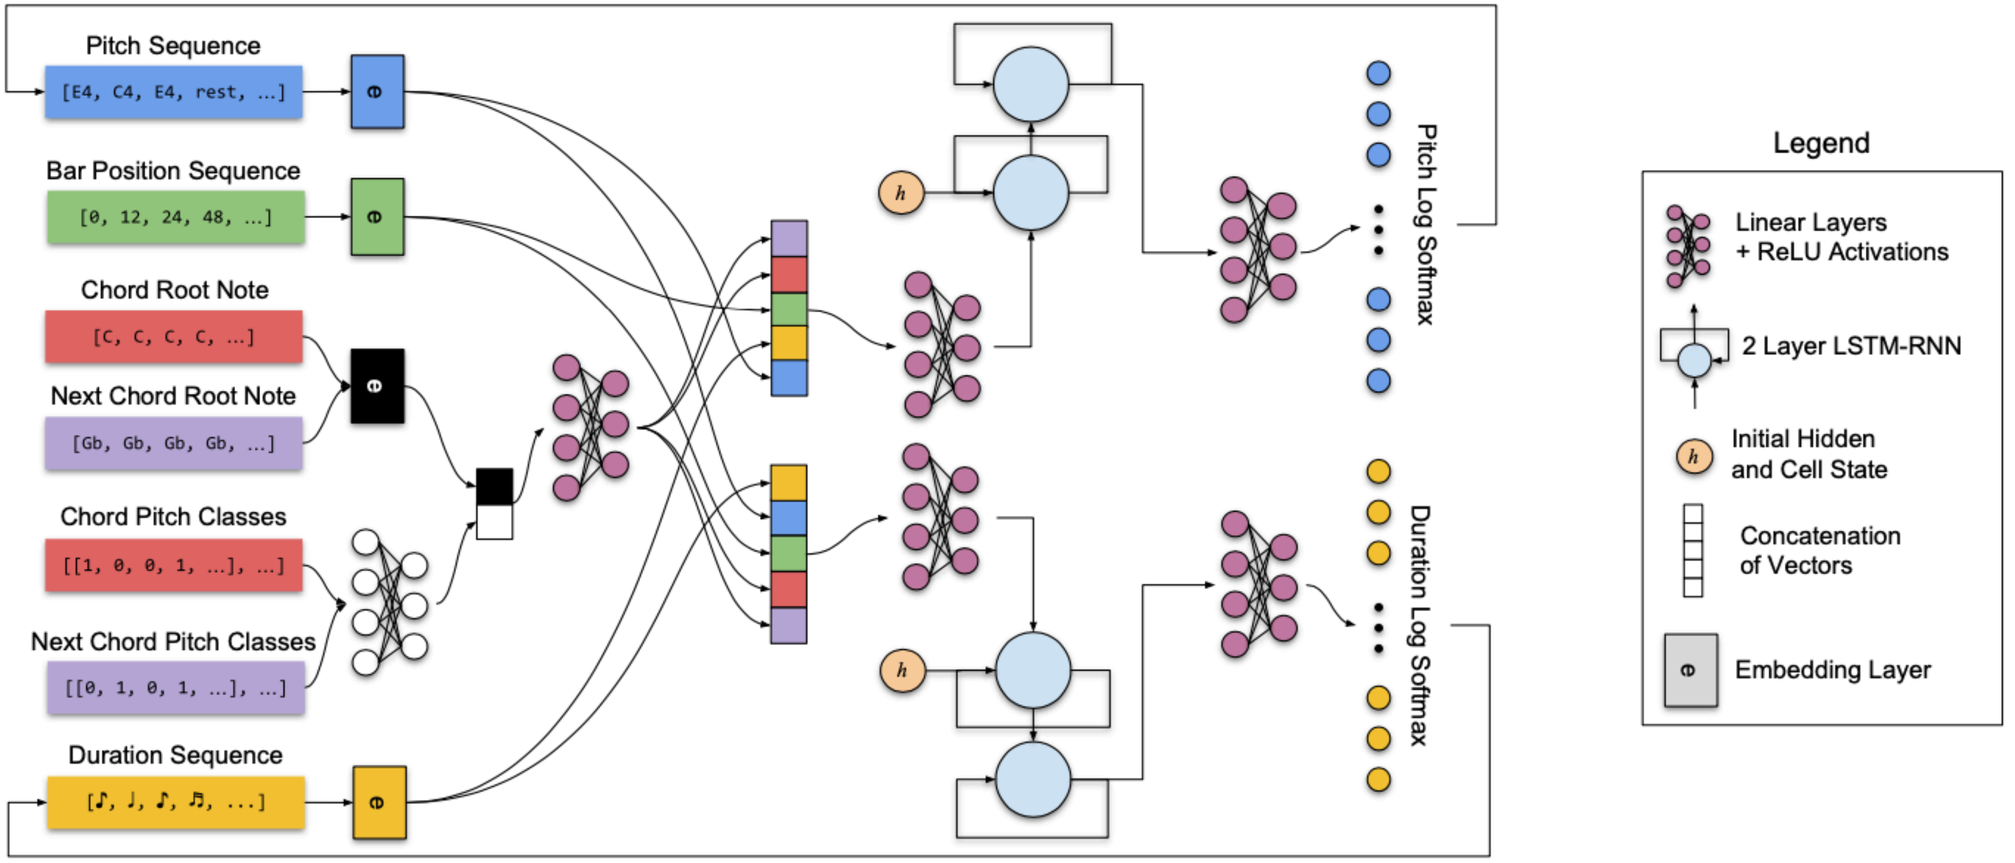
- Pitch sequence
- Duration sequence

P = {rest, G4, Bb4, D5, rest, C5, Bb4, C5, A4, A4, F4, C4, Eb4, G4}
D = {♪, ♪, ♪, ♪, ♪, ♩, ♪, ♪, ♪, ♪, ♬, ♬, ♪, ♩.}
B = {0, 12, 24, 36, 48, 60, 84, 0, 12, 24, 36, 42, 48, 60}
C = {{G,[1,0,0,1,0,0,0,1,0,0,0,0]},...7 times, {F,[1,0,0,0,1,0,0,1,0,0,0,0]},...7 times}

Conditioning data

- Current chord (C)
- Next Chord (N)
- Bar-position sequence (B)
- Inter-conditioning between Pitch and Duration (I)

Model structure

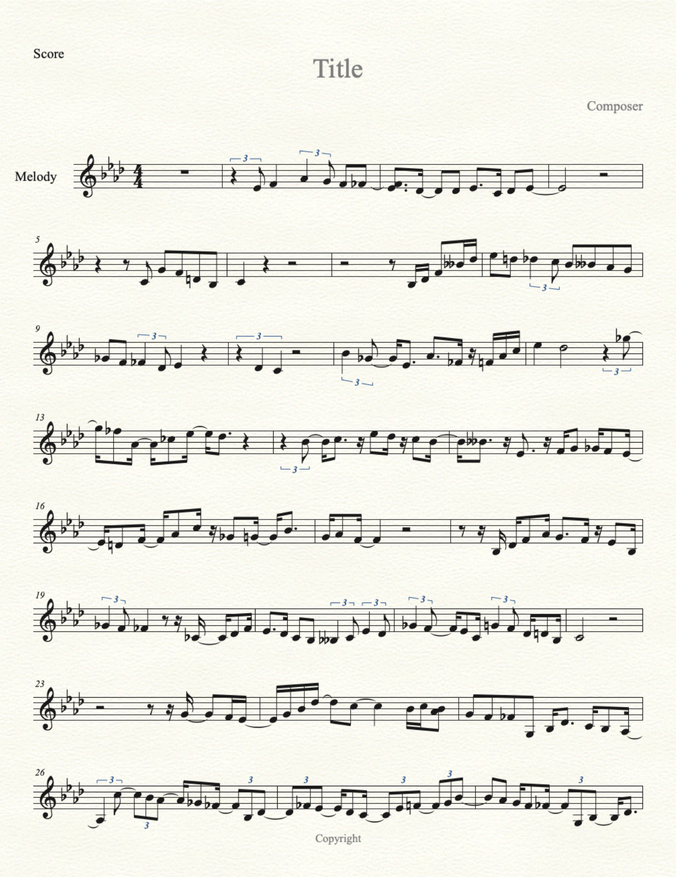


Approach

The experiment

Datasets

Weimar Jazz DB



Nottingham DB

Folk DB

Data representation

Example melody, from Miles Davis improvisation on Oleo, Weimar Jazz DB

$$P = [74, 72, 69, 65, 63, 62, R]$$

$$D = [16th,\ 16th,\ 8th\ note\ triplet,\ dot\ 16th,\ 8th\ note\ triplet,\ dot\ quarter,\ 8th]$$

Melody segmentation

Example of melody segmentation, from Charlie Parker improvisation on Donna Lee, Weimar Jazz DB

MINGUS architecture

Conclusions

Discussion and future work

Discussion and future work

Conclusions

- State of the art generation performance
- Good performance on complex music
- Motif-level coherence
- Highly adaptable architecture

Limitations

- No significant improvement with respect to RNN-based models
- Long-term coherence
- Pitch-class transition

Thank you!
